

How to add additional licences

In the QMSOFT release 4.xx (and higher) the activation of additional software licences will be done by an import of a new "**Codemeter licence file**". "Codemeter Stick" is the product name of the used dongle for the software protection.

The licence file to update an existing licence is called "Remote licence update file". Such a file will have the file extension "**.LWRemUpd**". The file name itself is the serial number of the existing Codemeter Stick.

NOTE: To arrange a licence update for an existing Codemeter Stick you should make sure that this Codemeter stick is plugged in on the local computer where you are doing the next operations. It is not possible to update the licence if the Codemeter stick is placed somewhere in the network.

To execute a remote licence update please do the following:

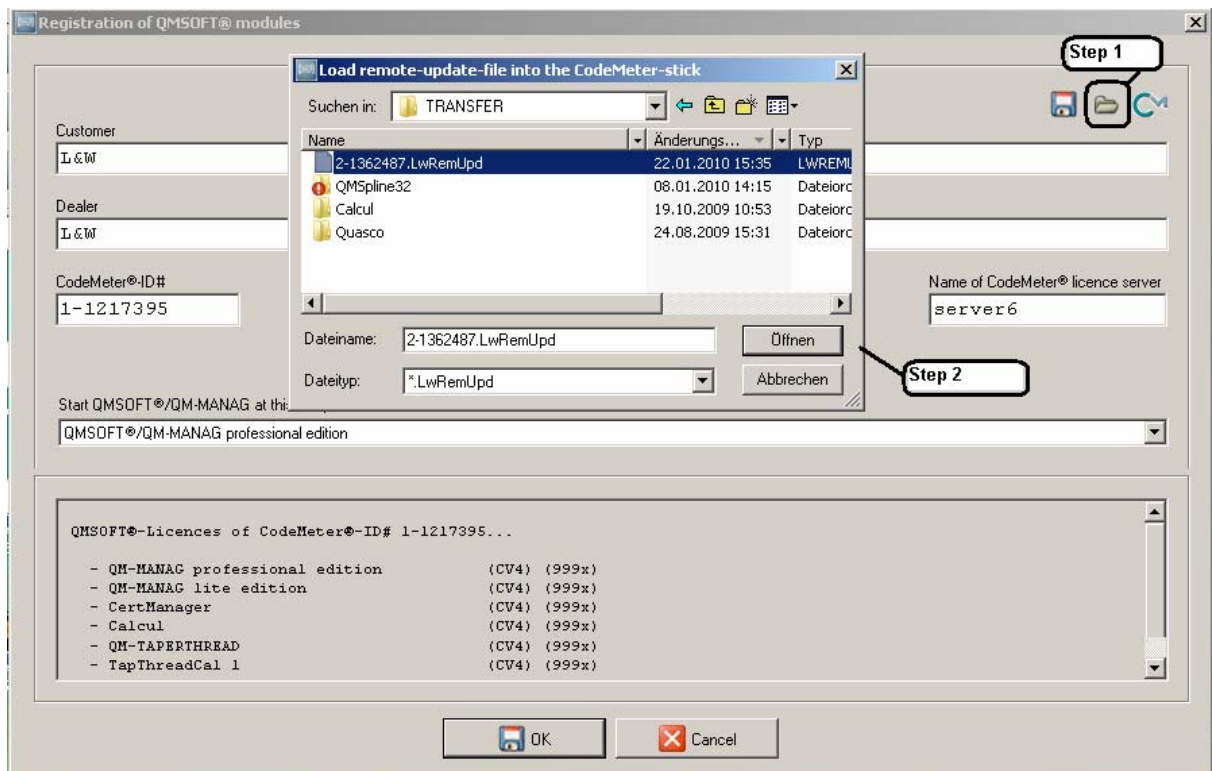

1) open the QMSOFT registration centre as shown in the figure

2) Load the "Remote update file"

You will now get a screen showing your existing licences;

Click the button "Load remote update file.." (see "Step 1") in the figure and "Open" the file in the next dialogue (see "Step 2")

After loading the "Remote Update File" close the licence dialogue by clicking the „OK“-button. From this point of time the changed licence volume can be used.
